

Abstract

- A plug-in module for the insertion into and extraction from a module frame that has at least one frontal structural bar, including a circuit board, a switch for the active-passive switching of the plug-in module and a swivel-mounted lever/pull
- 5 handle with a gripper arm located in the frontal area of the plug-in module. The gripping arm of the lever/pull handle has a rotatably connected control lever with a stepping pawl by which the switch can be operated during a completely inserted plug-in module. The stepping pawl of the control lever can have a locking nose that can lock behind a locking edge in the front area of the plug-in module.
